PRESS RELEASE

Priax designs video communication system for Kirtland Air Force Base
A Priax-Safeguards team project for dirty bomb detection

San Diego, December 1, 2004: Priax Corporation is working with Safeguards Technology in providing the video communications portion of a test installation for detecting dirty bomb nuclear material entering a military installation. The complete system consists of nuclear material detection equipment plus video surveillance, perimeter security and communications to a central security point. Priax Corporation will be providing the design and fabrication of several high quality video communications and control links. These links will connect all field surveillance equipment with the central security point. The distances in most cases are over several miles, and the requirement for high resolution video must be maintained.
